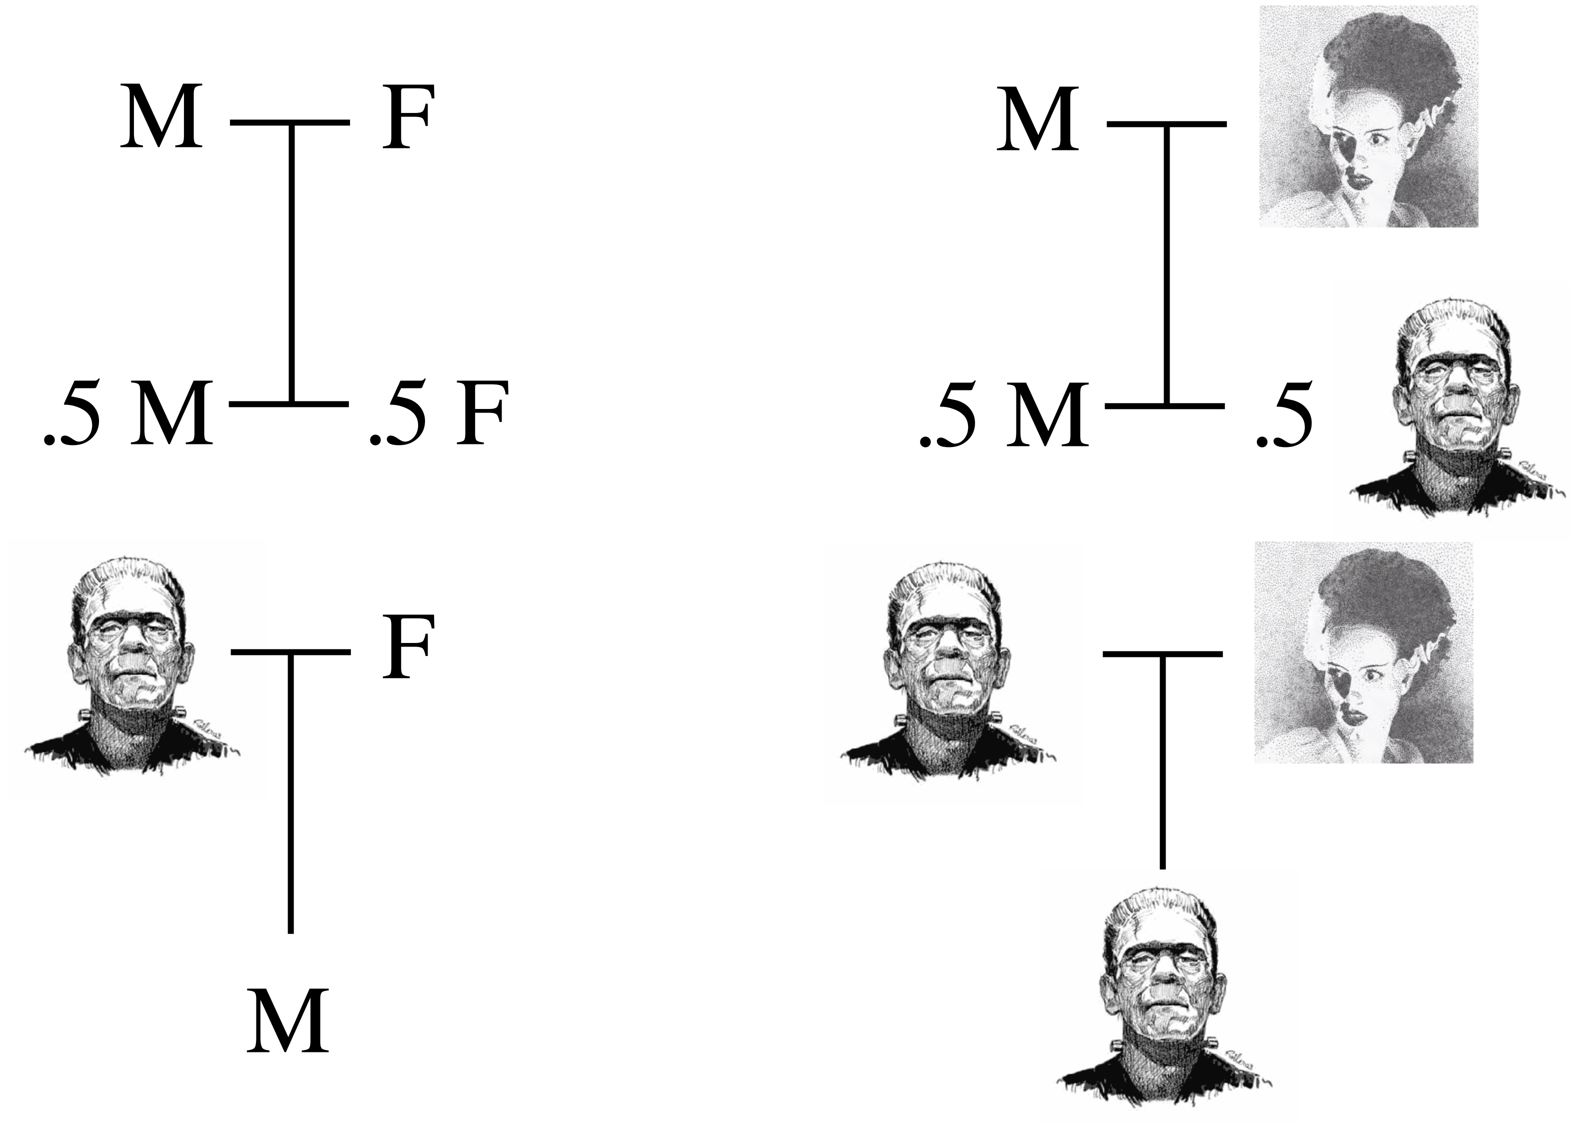
The Problem

Solutions

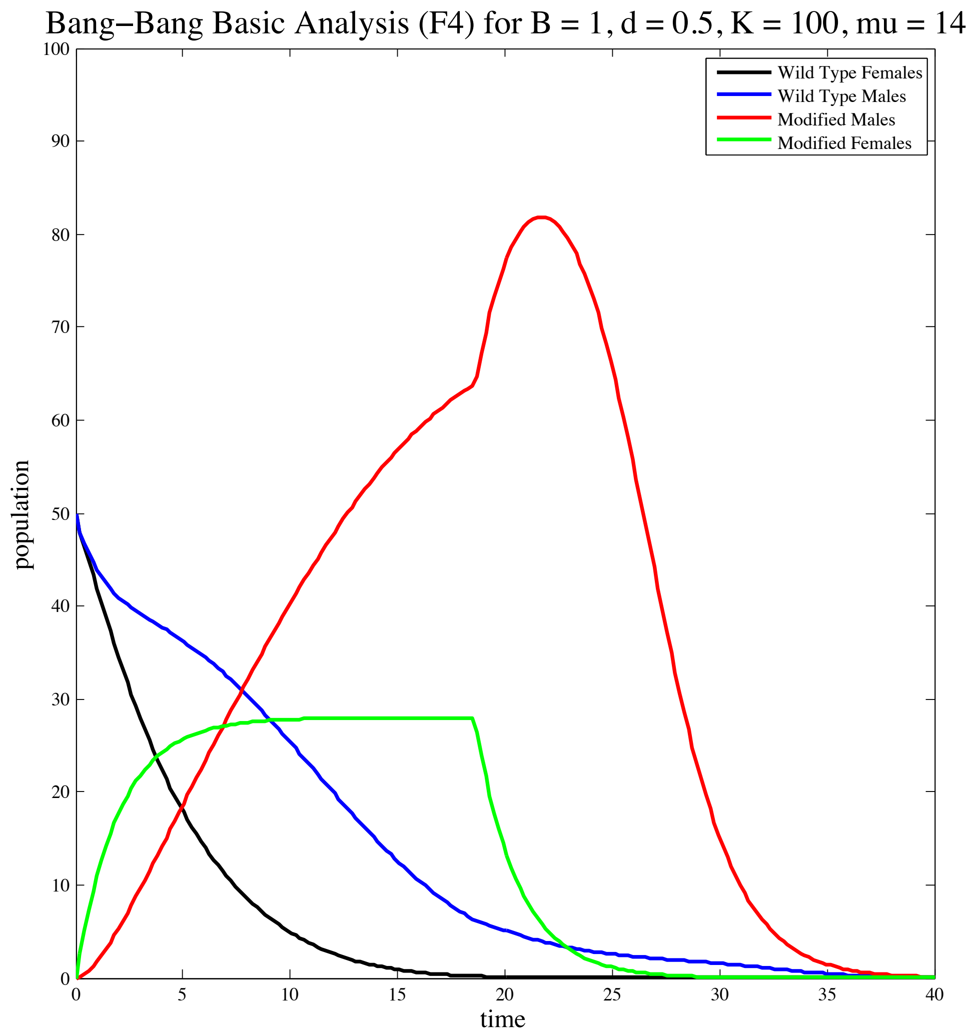
- Poison
- Introduction of Foreign Species

Trojan Breeding



Basic Model

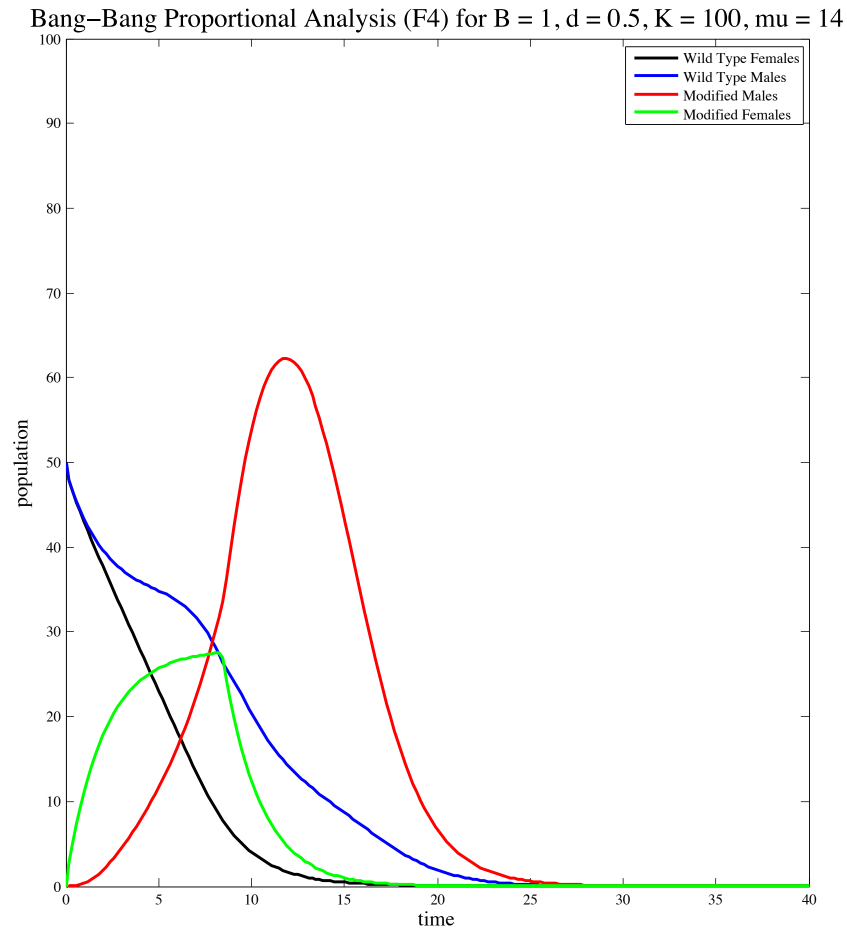
$$\frac{df}{dt} = \frac{1}{2}\beta f m L - \delta f$$
$$\frac{dm}{dt} = (\frac{1}{2} f m + \frac{1}{2} r m + f s)\beta L - \delta m$$
$$\frac{ds}{dt} = (\frac{1}{2} r m + r s)\beta L - \delta s$$
$$\frac{dr}{dt} = \mu - \delta r$$
$$L = 1 - \frac{f+m+s+r}{K}$$



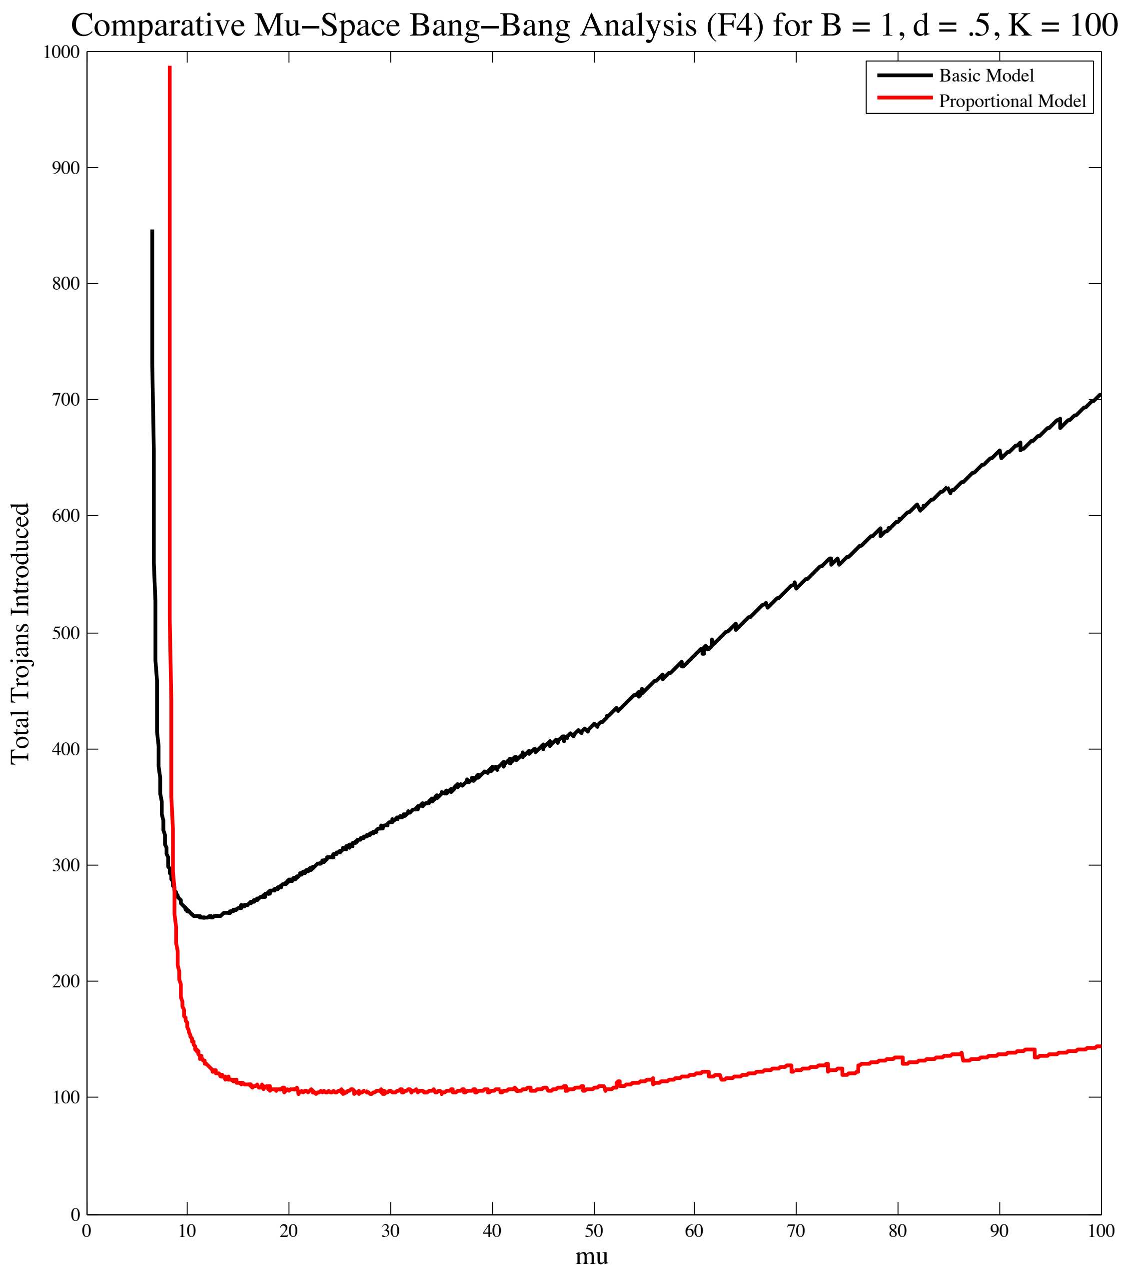
Proportional Model

$$\frac{df}{dt} = \frac{1}{2}\beta f m P_{fm} L - \delta f$$
$$\frac{dm}{dt} = (\frac{1}{2} f m P_{fm} + \frac{1}{2} r m P_{rm} + f s P_{fs})\beta L - \delta m$$
$$\frac{ds}{dt} = (\frac{1}{2} r m P_{rm} + r s P_{rs})\beta L - \delta s$$
$$\frac{dr}{dt} = \mu - \delta r$$
$$L = 1 - \frac{f+m+s+r}{K}$$

$$P_{fm} = \frac{fm}{(m+s)(f+r)}$$
$$P_{fs} = \frac{fs}{(m+s)(f+r)}$$
$$P_{rm} = \frac{rm}{(m+s)(f+r)}$$
$$P_{rs} = \frac{rs}{(m+s)(f+r)}$$



μ Minimization



Stochasticity

- Low Population Systems
- Random Events

0-Dimensional System

$F\ Birth = \frac{1}{2}\beta fm$
$M\ Birth = \beta(\frac{1}{2}fm + \frac{1}{2}rm + fs)$
$S\ Birth = \beta(\frac{1}{2}rm + rs)$
$R\ Birth = \mu$
$L' = \frac{f+m+s+r}{K}$

$F\ Death = \frac{1}{2}\beta fmL' + f$
$M\ Death = \beta L'(\frac{1}{2}fm + \frac{1}{2}rm + fs) + m$
$S\ Death = \beta L'(\frac{1}{2}rm + rs) + s$
$R\ Death = r$
